

The Secret of the Blue Observatory

In the quiet mountain village of **Velmora**, there stood an old building known as the **Blue Observatory**. Very few people knew its history because it had been closed for over fifty years.

The observatory was built in **1987** by a scientist named **Dr. Elian Voss**, who believed that every star had a unique pattern that could be used to predict unusual weather events. His only assistant was **Mira Solen**, a young engineer famous for designing a telescope called the **Aurora Lens**.

Inside the observatory was a locked room known as the **Silver Chamber**. Only Dr. Elian Voss possessed the special brass key required to open it. According to his journal, the chamber contained a notebook called the **Celestial Archive**, which held over **4,218 handwritten star observations** collected during twenty years of research.

Every year on **14 September**, the villagers gathered near the observatory to celebrate the **Festival of the Seventh Star**. During the celebration, an old clock named the **Northwind Clock** rang exactly **seven times at 9:15 PM**, signalling the start of the ceremony.

After Dr. Voss retired, the observatory was cared for by a librarian named **Nora Ashfield**, who kept the brass key inside a wooden box marked "**Aster-17**". She never allowed anyone to remove the Celestial Archive from the Silver Chamber.

In **2021**, a university researcher named **Lucas Arden** visited Velmora to study the observatory. After reading the Celestial Archive, he concluded that Dr. Voss had correctly predicted **18 rare mountain storms**, making the Blue Observatory one of the most remarkable forgotten research sites in the region.
